This rehabilitation program is designed to return the individual to their activities as quickly and safely as possible. It is designed for rehabilitation following a stress fracture. A stress fracture is a partial or incomplete fracture caused by the accumulation of stress in a localized area of bone. Modifications to this guideline may be necessary depending on physician-specific instruction, specific tissue healing timeline, chronicity of injury and other contributing impairments that need to be addressed. This evidence-based stress fracture rehabilitation guideline is criterion-based. Time frames and visits in each phase will vary depending on many factors including patient demographics, goals and individual progress. This guideline is designed to progress the individual through rehabilitation to full sport and activity participation. The therapist may modify the program appropriately depending on the individual’s goals for activity following stress fractures.

This guideline is intended to provide the treating clinician with a frame of reference for rehabilitation. It is not intended to substitute clinical judgment regarding the patient’s post-injury care, based on exam or treatment findings, individual progress, and/or the presence of concomitant injuries or complications. If the clinician should have questions regarding progressions, they should contact the referring physician.
General Guidelines/Precautions:

• Rest from pain-provoking activities remains the most effective, if often prolonged, intervention approach at this time.

• Excessive foot pronation if found should be addressed. Focus on the entire lower extremity kinetic chain.

• The general healing timeline varies depending on severity and chronicity (between 4–12 weeks).

• Assess and treat the lower extremity kinetic chain from the lumbopelvic region to the foot.

• Severity/Irritability/Nature/Chronicity of symptoms may affect progressions.
## Stress Fracture Rehabilitation Guideline

<table>

<tr>
<th>PHASE</th>
<th>SUGGESTED INTERVENTIONS</th>
<th>GOALS/MILESTONES FOR PROGRESSION</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Phase I</strong>&lt;br&gt;Acute Phase&lt;br&gt;Weeks: 7-21 days but may be up to 4 weeks depending on chronicity&lt;br&gt;Expected visits: 1-4</td>
<td><strong>Discuss:</strong>&lt;br&gt;Anatomy, existing pathology, rehab schedule and expected progressions.&lt;br&gt;&lt;br&gt;<strong>Specific Instructions:</strong> Use of a cast, boot or pneumatic leg splint for 2–4 weeks.&lt;br&gt;&lt;br&gt;<strong>Suggested Treatments:</strong>&lt;br&gt;• Modalities as indicated: Cryotherapy, low-intensity pulsed ultrasound, soft tissue mobilization, electrical stimulation&lt;br&gt;• ROM: Gastrocnemius, soleus, flexor digitorum, tibialis posterior&lt;br&gt;• Manual Therapy: Soft tissue mobilization of the lower extremity kinetic chain, joint mobilization to joints of the lower extremity kinetic chain where impairments are present (i.e., talocrural joint). Consider forefoot mobilization.&lt;br&gt;<strong>Exercise Examples:</strong>&lt;br&gt;• NWB lower body strengthening focusing on gluteals: Clams, side-lying straight leg raise, fire hydrants&lt;br&gt;• Core strengthening: Planks, side planks, Pallof holds progressing from standing to half kneeling, to kneeling&lt;br&gt;• Stretching: Hip flexors/quadriceps, hamstrings, gastrocnemius and soleus&lt;br&gt;Ankle invertor and evertor, foot intrinsic strengthening&lt;br&gt;May continue with upper body strengthening&lt;br&gt;<strong>Other Activities:</strong>&lt;br&gt;• Cycling or upper body ergometry</td>
<td><strong>Goals of Phase:</strong>&lt;br&gt;1. Removal of stress from injured area&lt;br&gt;2. Pain management&lt;br&gt;3. Prevent deconditioning&lt;br&gt;4. Educate on activity modification&lt;br&gt;5. Improved flexibility/range of motion, if found to be limited&lt;br&gt;6. Reestablished dynamic muscle control, balance and proprioception&lt;br&gt;<strong>Criteria to Advance to Next Phase:</strong>&lt;br&gt;1. No pain to palpation of involved bone&lt;br&gt;2. Pain-free ADLs&lt;br&gt;3. Dorsiflexion within 5° or less of non-involved side</td>

### Stress Fracture Rehabilitation Guideline

**Phase II**  
*Subacute Phase*  
*Weeks 4-6*  
*Expected visits: 4-8*

**Specific Instructions:** Establish gradual return to prior level of function. Start at <50% prior training volume. Abide by soreness rules (see appendix).

**Suggested Treatments:**
- **Modalities as indicated:** Edema-controlling treatments  
- **ROM:** Ankle DF ROM  
- **Manual Therapy:** Continue as needed for joint and soft tissue limitations throughout the lower extremity kinetic chain

**Exercise Examples:**
- **Foot/ankle strengthening**  
  - Progress balance activities, emphasis single-limb stability  
  - Single leg heel raises  
  - Foot intrinsic strengthening in weight-bearing position  
- **Lower extremity mobility**  
  - Gastrocnemius/soleus stretching  
  - Continue to address lower extremity kinetic chain mobility deficits  
- **Hip strengthening**  
  - Double and single limb proximal stability exercise, may include: squats, single leg squats, lunges with forward trunk lean, step ups, step downs, lateral band walks

**Other Activities:**
- Swimming, deep water/pool running, Alter G, if available at pain-free level, encourage shock absorption strategies such as increasing step rate, step width and/or forward trunk lean

**Goals of Phase:**
1. Initiation of return to activity

**Criteria to Advance to Next Phase:**
1. Ability to single leg hop 15 times without pain or discomfort  
2. 30-minute walk with minimal to no increase in pain  
3. 6 repetitions, 6 seconds at 60% body weight squat  
4. >25 single leg heel raises bilaterally

<tr>
<th>Phase III</th>
<th>Specific Instructions:</th>
<th>Goals of Phase:</th>
</tr>
</thead>
</table>
| Advanced  Strengthening | - Continue with previous exercise program. A good guideline is to increase activity by no more than 15-20% per week  
- Consider the Return to Running program’s (see appendix) | 1. Return to running  
2. Return to recreational/sporting activity  
3. Normal lower extremity kinetic chain strength  
4. Normal lower extremity kinetic chain muscle length |
| Weeks 6-10 | **Suggested Treatments:**  
- **Modalities Indicated:** Continue as needed for pain control  
- **Manual Therapy:** Continue as needed for joint and soft tissue limitations throughout the lower extremity kinetic chain |
| Expected visits: 4-9 | **Exercise Examples:**  
- **Plyometrics:** Emphasis on soft landing and hip strategy  
  - Double limb: box jumps, drop jumps, forward jumps, tuck jumps  
  - Single limb: lunge hop, single box hop, drop with single leg land, single forward hop  
- **Foot/ankle strengthening**  
  - Continue balance and foot intrinsic strengthening in single limb weight-bearing position  
- **Lower extremity mobility**  
  - Continue to address lower extremity kinetic chain mobility deficits  
- **Hip strengthening**  
  - Continue single limb proximal stability exercises | **Criteria to Advance to Next Phase:**  
1. Pain-free completion of interval running program |
| **Phase IV** | **Specific Instructions:** |  
| Return to full activity | - Continue with proper load management and progression to full activity |
Post Stress Fracture Return-to-Running Program

This program is to be used for returning to continuous running following injury. It should be started once you are able to walk 30 min consecutively without pain/injury. A minimum of one off-day is required between running sessions.

Begin each session with a warm-up consisting of a 2-5 min brisk walk followed by your specific stretching/activation exercises. All running is intended to be performed at easy or conversational pace. Perform the appropriate walk/run combination based on the table below. Be sure to follow the walk/run with your stretching exercises.

<table>
<thead>
<tr>
<th>Week</th>
<th>Day 1</th>
<th>Day 2</th>
<th>Day 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>6x: walk – 4.5 min.</td>
<td>6x: walk – 4.0 min.</td>
<td>6x: walk – 3.5 min.</td>
</tr>
<tr>
<td></td>
<td>run – 0.5 min.</td>
<td>run – 1.0 min.</td>
<td>run – 1.5 min.</td>
</tr>
<tr>
<td>2</td>
<td>6x: walk – 3.0 min.</td>
<td>6x: walk – 2.5 min.</td>
<td>6x: walk – 2.0 min.</td>
</tr>
<tr>
<td></td>

<td>run – 3.5 min.</td>
<td>run – 4.0 min.</td>
<td>run – 4.5 min.</td>
</tr>
<tr>
<td>4</td>
<td>run – 30 min.</td>
<td>run – 30 min.</td>
<td>run – 30 min.</td>
</tr>
</tbody>
</table>

Upon completing Week 4, you may resume a gradual transition back to continuous running following a 2 min warm-up walk and stretching. As you return to your pre-injury running level, training duration or intensity should be increased by no more than 10-20% per week to minimize risk for injury recurrence. Be sure to continue your stretching program as instructed.

Higher-risk stress fracture sites or higher-grade fractures may warrant slower progression and/or a greater number of recovery days – defer to PT or ATC guidance.

**Soreness Rules – Related to pain or soreness at stress fracture site**

<table>
<thead>
<tr>
<th>Criterion</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Soreness during warm-up that continues</td>
<td>2 days off, return to prior step</td>
</tr>
<tr>
<td>2. Soreness during warm-up that goes away</td>
<td>Stay at step until completed without soreness</td>
</tr>
<tr>
<td>3. Soreness during warm-up that goes away but redevelops during session</td>
<td>2 days off, return to prior step</td>
</tr>
<tr>
<td>4. Soreness the day after lifting</td>
<td>1 day off, do not advance program to the next step</td>
</tr>
</tbody>
</table>
